## PROFESSIONAL SUMMARY

Software Engineer with 5+ years of experience, specializing in Flutter/Dart mobile development, with additional experience in web and backend development. Served as lead mobile developer on multiple production applications, built from the ground up and deployed for real client use. Known for precision driven implementation of critical business logic (e.g., gold weight calculations, bid pricing systems), a strong focus on clean UI/UX and app performance, and consistent client communication. Comfortable working independently or within a team, explores AI/ML integration through personal projects, and leverages modern AI-assisted development tools to accelerate delivery. Passionate about coding and continuously exploring new technologies to grow as an engineer.

## WORK EXPERIENCE

**Infonet Global Tech** — **Bandung, Indonesia**
*Software Engineer* — June 2021 – Present

- Served as the **primary developer (Flutter)** across multiple client projects, independently owning **end to end implementation** from architecture and technical decisions through to delivery across production ready Android and iOS applications.
- Delivered mobile solutions across **diverse business domains** including **offline first financial systems** and **realtime auction platforms** adapting architecture to each domain's unique data and connectivity requirements
- Translated business development needs into functional, **client ready prototypes** providing the technical foundation that enabled the sales team to secure **enterprise partnerships**.

## SOFTWARE PROJECTS

**Gold Trading & Sales App (Sinar Agung)**

- Designed an **offline first** architecture to support **100+ sales agents** operating across Indonesia, ensuring uninterrupted transaction recording despite inconsistent connectivity in remote areas.
- Resolved a **critical data integrity issue** in the receivables system that could cause inaccurate balance reporting, by redesigning the calculation logic with an **immutable base field**.
- Eliminated rounding errors in gold weight calculations caused by a **floating point precision limitation**, preventing financial discrepancies in high value transactions.

**Field Inspection App (Infonet Global Tech)**

- Built a customizable field inspection platform that was successfully **sold and adopted by multiple enterprise clients**, following live prototype demonstrations to prospective customers.
- Designed a conditional, **multi format questionnaire engine** supporting photo evidence, GPS geofencing, and digital signatures allowing flexible customization per client and industry requirements.
- Architected the app's core logic (Provider based state management, dynamic form navigation) to support **scalability across multiple client** use cases with minimal code changes.

**AutoFleet Capital**

- Served as the dedicated mobile developer for an **international client facing** car auction platform (Philippines based client, sourcing vehicles from Japan and New Zealand), working the entire mobile frontend while collaborating with the client's web team.

- Built end to end auction functionality covering **realtime bidding, automated transaction confirmations**, and **user specific activity tracking** (history, saved listings, and inventory visibility) enabling users to discover, bid, and manage vehicle auctions seamlessly from a single app.
- Delivered a **production ready** mobile platform engineered for reliability under concurrent bidding activity, supporting live auction operations for an overseas enterprise client.

**Deenly Islamic Companion App (Personal Project)** [Github]

- Independently designed and developed a personal **Islamic companion app** (Flutter) published as an **open source project on GitHub** with downloadable releases.
- Built core Islamic companion features including **prayer time tracking** with adjustable settings and **custom adhan notifications**, **Qibla direction finder** and **nearby mosque locator**, and **Quran reader** with **daily hadith** modules including **multi language localization** support.
- Engineered a home screen widget with scheduled background updates via **WorkManager**, syncing realtime prayer data from the **Al Adhan API** with **local SQLite** caching, and implemented dark mode theming for a polished user experience.

## EDUCATION

**Padjadjaran University** **Bandung, Indonesia**
*Bachelor of Electrical Engineering* April 2020

- **GPA:** 3.51 / 4.0
- **Awards**: PPA Regular scholarship 2018 and 2019
- **Thesis Research**:
  "Automatic System of Feeding Pets Using Android Based on Internet of Things"
  - Designed and built a **multi module IoT pet feeding system** integrating **Arduino Uno**, **NodeMCU**, and **ESP32CAM (OV2640)** for automated feeding, realtime scheduling **(RTC DS3231)**, and remote visual monitoring.
  - Developed a **native Android application in Kotlin**, enabling users to remotely control feeding schedules and view live camera monitoring, synced in realtime via **Firebase**
  - Applied **fullstack IoT development** skills spanning embedded systems, cloud database integration, and native mobile development

## SKILLS

**Programming Languages:** Dart, Kotlin, Python, Javascript, TypeScript
**Frameworks & Libraries**: Flutter, native Android SDK, Next.js, Node.js
**Databases & Storage:** SQLite, Firebase, ObjectBox
**Tools & Platforms**: Git/GitLab, Android Studio, VS Code, Postman, ADB, Vercel
**Practices/Methodologies**: REST API Integration, CI/CD
**AI Tools:** Claude Code, Antigravity
**Spoken Languages**: Indonesian (Native), English (Professional)
